WIN32: NOTIFY

Notify 1.0 - Alerts user when watched files/directories are modified, low overhead

License: Freeware

Runs hidden in the background until it detects any kind of change in a directory it has been told to monitor. When a change occurs (e.g. create, delete, modify a file) it visually alerts the user. Can be used, for example, to detect incoming information over a network or to detect tampering of files. Uses very little memory and practically no CPU time.
